

DreamLog AI

Local AI Dream Journal & Pattern Analyser

DAY 12 | JULY 9, 2026

Log your dreams. AI finds the symbols. Patterns reveal the story.

Category	Details
Startup Name	DreamLog AI
Type	Offline AI Dream Journal + Pattern Analyser (Mobile-Only)
Stack	Vanilla HTML/JS + Ollama
Models	llama3.2, mistral, gemma2, qwen2.5
Features	Mood tagging, clarity rating, auto-interpretation, theme cloud, pattern report
Privacy	100% Local — Dream Data Never Leaves Device
Author	Mayank Swaraj / Mayank Creations
Series	Daily Local LLM Startup — Day 12
GitHub	github.com/mayankswaraj18cr-cmd
LinkedIn	linkedin.com/in/mayank-swaraj-4b84b6410

WHITEPAPER

DreamLog AI: Jungian Dream Intelligence on Local LLM

Abstract

DreamLog AI is a mobile-first, offline dream journaling tool that uses a locally-running LLM to interpret dream symbols using Jungian and cross-cultural psychology frameworks, then analyses patterns across multiple entries to surface recurring themes and emotional states. All dream content — among the most intimate personal data possible — stays entirely on the device.

1. Problem Statement

Dream journaling apps (Dreamboard, Shadow, DreamKit) store dream entries on cloud servers, raising significant privacy concerns given the deeply personal and psychologically revealing nature of dream content. AI-powered dream interpretation requires expensive cloud API calls in existing tools. No tool combines local AI interpretation with longitudinal pattern analysis across a personal dream archive.

2. Solution

- Mood emoji selector — 6 emotional states captured per entry
- Clarity slider — 1-5 vividness rating per dream
- Theme tag chips — 12 common dream motifs for one-tap categorisation
- Auto-interpretation — fires Ollama analysis immediately after save if connected
- On-demand interpretation — any unanalysed dream can be interpreted later
- Mood distribution bars — visual breakdown of emotional states across all dreams
- Theme cloud — frequency-weighted tag display; larger = more recurring
- AI pattern report — cross-entry analysis of recurring symbols, emotional themes, and evolution

3. Technical Architecture

Layer	Technology	Role
UI	Vanilla HTML5/CSS3 (mobile-only)	3-tab: Log, Dreams, Patterns. Georgia serif for dream text. Max-width 480px
Logic	Vanilla JS	Dream CRUD, mood/tag state, auto-interpret trigger, pattern computation
Storage	localStorage	dreams[] array; each entry stores text, mood, clarity, tags, interpretation
AI Runtime	Ollama	Two prompt types: single-dream symbol analysis + cross-entry pattern report
Prompt Design	Jungian framing	Analyst persona with explicit warmth/non-prescriptive constraint

4. Prompt Design: Jungian Framing

The interpretation prompt explicitly invokes Jungian psychology and cross-cultural symbolism, then constrains the tone to be warm and non-prescriptive. This prevents the model from making authoritative psychological claims while still producing substantive, insightful analysis:

```
"You are a compassionate dream analyst with knowledge of
Jungian psychology and cross-cultural dream symbolism."
"Provide: 1) key symbols and what they may represent,
2) overall emotional theme,
3) one gentle personal insight."
"Keep it warm, thoughtful, and non-prescriptive."
```

The non-prescriptive constraint is ethically important: dream interpretation is inherently speculative. The prompt explicitly prevents the model from stating definitive psychological diagnoses while still producing meaningful reflection prompts.

5. Market Opportunity

The mental wellness journaling market exceeded USD 800M in 2024. Dream journaling specifically is experiencing a resurgence driven by growing interest in sleep science and Jungian psychology content on social platforms. The privacy angle is especially acute here — dreams reveal unconscious psychological states that users would never want stored on corporate servers. DreamLog AI targets this intersection of intimacy and insight.

6. Monetization

Tier	Price	Offering
Free	USD 0	Unlimited logging, 10 AI interpretations/month, basic pattern stats
Pro	USD 5/mo	Unlimited interpretations, monthly pattern PDF, dream search
Lifetime	USD 29	Everything in Pro forever
Wellness Bundle	USD 12/mo	DreamLog + LocalMind + VoiceNote AI (series bundle)

SOURCE CODE PAPER

Annotated technical breakdown of DreamLogAI.html

SOURCE CODE PAPER

DreamLogAI.html — Annotated Technical Breakdown

Overview

DreamLog AI is a single HTML file storing dreams as a JSON array in localStorage. Each dream object carries all metadata including the AI interpretation string. Auto-interpretation fires asynchronously after save without blocking the UI. The patterns tab computes all statistics client-side from the dreams array.

Section 1: Dream Object Schema

```
{
  id: "timestamp-string",
  text: "full dream description",
  mood: "emoji-string",
  clarity: 1-5,
  tags: ["Flying", "Water", ...],
  date: "ISO-8601-string",
  interpretation: "AI analysis string or null"
}
```

The interpretation field is null at save time and populated asynchronously by `autoInterpret()`. This allows the dream to be saved and displayed immediately while AI analysis runs in the background.

Section 2: Auto-Interpret on Save

Interpretation fires non-blockingly after save:

```
function saveDream() {
  // ... build dream object, push to array, save, render ...
  if(ollamaConnected) autoInterpret(dream.id);
  // returns immediately; interpretation updates card when done
}

async function autoInterpret(id) {
  // fires silently; re-renders card on completion
  dream.interpretation = await callOllama(prompt);
  localStorage.setItem(...); renderDreams();
}
```

Section 3: Pattern Computation

All pattern stats computed client-side from dreams array:

```
// Mood frequency
dreams.forEach(d => moodCounts[d.mood] = (moodCounts[d.mood]||0)+1);
```

```
// Tag frequency for theme cloud
dreams.forEach(d => d.tags.forEach(t => tagCounts[t]=(tagCounts[t]||0)+1));

// Size class by frequency ratio
var ratio = tagCounts[t] / maxTag;
var cls = ratio>0.7 ? "lg" : ratio>0.3 ? "" : "sm";
```

Section 4: Function Reference

Function	Role
saveDream()	Builds dream object, pushes to array, resets form, calls autoInterpret() async
autoInterpret(id)	Fires Jungian analysis prompt silently; updates interpretation field; re-renders
interpretDream(id)	On-demand version of autoInterpret with visible loading state in card
renderDreams()	Maps dreams[] to card HTML; handles null interpretation with "Interpret" button
renderPatterns()	Computes mood/tag counts; renders bars + theme cloud + pattern report button
generatePatternReport()	Concatenates last 10 dreams; fires cross-entry pattern analysis prompt

03

HISTORY PAPER

Origin story, design decisions, and build log

HISTORY PAPER

DreamLog AI — Origin, Design Decisions & Build Log

Origin Story

DreamLog AI is Day 12 of the Mayank Creations Daily Local LLM Startup series, built July 9, 2026. Day 1 (LocalMind) established the waking journal. Day 12 completes the journaling arc with the unconscious counterpart — the dream journal. Dreams represent perhaps the single most privacy-sensitive personal data type: they reveal unconscious fears, desires, and psychological states that users would never voluntarily share with a cloud service.

Design Philosophy

Georgia Serif for Dream Text

The dream textarea and card excerpts use Georgia serif instead of the system sans-serif used everywhere else. This typographic shift creates a subtle psychological separation between the dream space and the productivity interface — serif fonts feel more contemplative, personal, and literary, appropriate for recording unconscious experience.

Deep Navy/Indigo Palette

The near-black navy (#060610) and violet (#a78bfa) evoke night, sleep, and the unconscious — the deepest, most restful dark palette in the series. It is deliberately calmer and more mysterious than FocusFlow's focus-mode indigo.

Non-Prescriptive Prompt Constraint

The explicit "warm, thoughtful, and non-prescriptive" constraint in the interpretation prompt is an ethical design decision. Dream interpretation carries psychological weight — the tool should prompt reflection, not deliver diagnoses. This constraint prevents the LLM from making authoritative claims about the user's mental state.

Auto-Interpret as Delight Feature

Firing interpretation automatically after save (when Ollama is connected) means the user returns to the Dreams tab to find their entry already analysed — a "magic" moment that demonstrates the tool's value without requiring an extra tap. The async fire-and-forget pattern ensures this never blocks the save flow.

Build Log — July 9, 2026

Time	Action	Decision
T+0:00	Idea selection	Dream journal — completes waking/sleeping journaling arc; highest privacy sensitivity in series
T+0:15	Data schema	dreams[] with interpretation:null; auto-populated async; all metadata in one object

T+0:30	Log form	Mood chips + clarity slider + Georgia textarea + theme tag chips
T+0:50	Auto-interpret	saveDream() fires autoInterpret() async; card updates silently on completion
T+1:10	Jungian prompt	Explicit analyst persona + symbol/theme/insight structure + non-prescriptive constraint
T+1:30	Patterns tab	Client-side mood counts + tag frequency + size-classed theme cloud
T+1:50	Pattern report	Last 10 dreams concatenated; 4-part cross-entry analysis prompt
T+2:10	Typography	Georgia serif for dream text fields — psychological separation from UI
T+2:25	GitHub + LinkedIn	Links included per series standing instruction
T+2:35	Documentation	Whitepaper, Source Code Paper, History Paper compiled into single PDF

Key Decisions Rejected

Rejected	Why Rejected
Freudian interpretation frame	Freudian analysis is more prescriptive and pathologising; Jungian frame is warmer and symbol
Dream search by keyword	Text search across localStorage strings possible but adds scope; deferred to Pro tier
Sleep time/duration tracking	Requires additional input fields that slow down the morning logging flow; deferred
Sharing/export of dream entries	Dreams are the most private data in the series; sharing features deliberately excluded from free
Recurring character tracking	Interesting feature but requires entity extraction prompt + separate data store; deferred to v2

What Day 13 Could Build On

- Dream search by keyword or date range
- Recurring character/person tracking
- Sleep duration input with quality correlation
- Monthly dream frequency chart (Canvas 2D)
- Export dream journal as PDF book
- Lucid dream technique suggestions based on patterns
